

Segmentation strategies for inflection class inference

Sacha Beniamine (LLF), Benoît Sagot (Alpage)
Université Paris Diderot

Décembrettes 9, Toulouse, 2015

- ▶ Concept of Inflection Classes widely used to analyse inflectional systems
 - ▶ The definition of IC is crucial for many linguistic and psycholinguistic studies, yet they are often taken for granted.

- ▶ Concept of Inflection Classes widely used to analyse inflectional systems
 - ▶ The definition of IC is crucial for many linguistic and psycholinguistic studies, yet they are often taken for granted.
- ▶ **No consensus** on how to obtain the classification

- ▶ Concept of Inflection Classes widely used to analyse inflectional systems
 - ▶ The definition of IC is crucial for many linguistic and psycholinguistic studies, yet they are often taken for granted.
- ▶ **No consensus** on how to obtain the classification
- ▶ **We explore the concept through computational means:**
Brown and Evans, 2012; Lee and Goldsmith, 2013; Bonami, 2014
 - ▶ Formal definitions of the concept
 - ▶ Large datasets
 - ▶ Reproducible classifications
 - ▶ Commensurable across languages
 - ▶ Basis for theoretical and typological comparisons

WHAT IS NEEDED TO INFER IC FROM PARADIGMATIC DATA*.

1. What form should an IC system take?
2. What Inflectional Realisations should we infer from the data?
3. How do we measure which lexemes inflect alike?
4. How do we find the best classes among all possible ones?

TABLE OF CONTENTS

1. What form should an Inflection class (IC) system take?
2. What generalisations should we infer from the data?
3. How do we assess which lexemes inflect alike?
4. How do we find the best classes among all possible ones?
5. Results and discussion
6. Conclusion

INFLECTION CLASSES: COHESIVE OR DISTINCTIVE?

- ▶ Insight from Canonical Typology (Corbett, 2009).
An ideal inflection class system is a partition of the set of lexemes that is:

A CLUSTERING PROBLEM

- ▶ In general, grouping elements into classes is a clustering problem.
- ▶ There are many well-known solutions in computer science to address such problems.
- ▶ All of them require two things:
 - ▶ A criterion to evaluate the quality of clusters (classes).
 - ▶ An algorithm to explore the search space of all possible groupings.

A CLUSTERING PROBLEM

TABLE OF CONTENTS

1. What form should an Inflection class (IC) system take?
2. What generalisations should we infer from the data?
3. How do we assess which lexemes inflect alike?
4. How do we find the best classes among all possible ones?
5. Results and discussion
6. Conclusion

- ▶ **Minimum description length** (Rissanen, 1984): Choose the model allowing for the shortest description of the data.
- ▶ A partition of the set of lexemes is better than another one if it leads to a more economical description of the system. (Sagot and Walther, 2011; Walther, 2013)

$$DL(system) =$$
$$number\ of\ symbols \times \underbrace{- \sum_{x \in symbols} P(x) \times \log_2 (P(x))}_{entropy}$$

DESCRIPTION LENGTH OF A PARTITION OF THE SET OF LEXEMES

- We break down the description length into four components:

Toy imaginary dataset with three cells A, B and D.

DESCRIPTION LENGTH OF A PARTITION OF THE SET OF LEXEMES

- We break down the description length into four components:

Toy imaginary dataset with three cells A, B and D.

DESCRIPTION LENGTH OF A PARTITION OF THE SET OF LEXEMES

CLUSTERING ALGORITHM, EX. ON EUROPEAN PORTUGUESE CONJUGATION.

- (a) Begin with a partition into microclasses.
- (b) Merge the pair optimising DL to get a new partition.
- (c) Repeat until there is only 1 class.
- (d) Run several times, merge variations.

- ▶ This allows for an intuitive formal definition of macroclasses
- ▶ Macroclasses: The partition that best optimises the description length.
 - ▶ As we merge clusters, we first expect the DL to decrease.
 - ▶ Macroclasses are reached when DL stops decreasing.
- ▶ It is an empirical issue whether a system has macroclasses or not.

We demonstrate their existence in French and European Portuguese conjugation systems.

TABLE OF CONTENTS

1. What form should an Inflection class (IC) system take?
2. What generalisations should we infer from the data?
3. How do we assess which lexemes inflect alike?
4. How do we find the best classes among all possible ones?
- 5. Results and discussion**
6. Conclusion

- ▶ Paradigm tables contain phonemically transcribed forms.
- ▶ **European Portuguese:** Coimbra pronunciation dictionary (Veiga, Candeias, and Perdigão, 2013) (1995 verbal entries).
- ▶ **French:** Flexique (Bonami, Caron, and Plancq, 2014) (5406 verbal entries).
- ▶ Comparing **local** and **global** segmentation strategies

PORTUGUESE CLASSIFICATION, GLOBAL PATTERNS

- **Global strategy** (stem & exponents): Produces scattered classes with no relationship to conventional knowledge of Portuguese verbal IC.

PORTUGUESE CLASSIFICATION, LOCAL PATTERNS

- **Local strategy** (alternation patterns): finds generalisations that display interesting relationship with traditional accounts.

PORTUGUESE CLASSIFICATION, LOCAL PATTERNS

- **Local strategy** (alternation patterns): finds generalisations that display interesting relationship with traditional accounts.

FRENCH CLASSIFICATION, GLOBAL PATTERNS

- **Global strategy (stem & exponents):** Produces scattered classes with no relationship to conventional knowledge of French verbal IC.

FRENCH CLASSIFICATION, LOCAL PATTERNS

- **Local strategy** (alternation patterns): finds generalisations that display interesting relationship with traditional accounts.

FRENCH CLASSIFICATION, LOCAL PATTERNS

- **Local strategy** (alternation patterns): finds generalisations that display interesting relationship with traditional accounts.

DISCUSSION

- ▶ We do find macroclasses

DISCUSSION

- ▶ We do find macroclasses
 - ▶ Not a bipartition (regular / irregular or productive/unproductive), contra Kilani-Schoch and Dressler, 2005

- ▶ We do find macroclasses
 - ▶ Not a bipartition (regular / irregular or productive/unproductive), contra Kilani-Schoch and Dressler, 2005
 - ▶ The algorithm had no knowledge of previous accounts.

DISCUSSION

- ▶ We do find macroclasses
 - ▶ Not a bipartition (regular / irregular or productive/unproductive), contra Kilani-Schoch and Dressler, 2005
 - ▶ The algorithm had no knowledge of previous accounts.
- ▶ We find groupings that were overlooked:

- ▶ We do find macroclasses
 - ▶ Not a bipartition (regular / irregular or productive/unproductive), contra Kilani-Schoch and Dressler, 2005
 - ▶ The algorithm had no knowledge of previous accounts.
- ▶ We find groupings that were overlooked:
 - ▶ French: -yer, -oir

- ▶ We do find macroclasses
 - ▶ Not a bipartition (regular / irregular or productive/unproductive), contra Kilani-Schoch and Dressler, 2005
 - ▶ The algorithm had no knowledge of previous accounts.
- ▶ We find groupings that were overlooked:
 - ▶ French: -yer, -oir
 - ▶ French: haïr, finir, -ure, uire

- ▶ We do find macroclasses
 - ▶ Not a bipartition (regular / irregular or productive/unproductive), contra Kilani-Schoch and Dressler, 2005
 - ▶ The algorithm had no knowledge of previous accounts.
- ▶ We find groupings that were overlooked:
 - ▶ French: -yer, -oir
 - ▶ French: haïr, finir, -ure, uire
 - ▶ Portuguese: two “irregular” groups.

COMPARISON TO OTHER WORKS

	Generalisations	Criterion	Algorithm
Brown and Evans, 2012	raw paradigms	Compression distance	CompLearn
Bonami, 2014	Affixes	Edit distance	UPGMA
Bonami, 2014	Patterns	Hamming distance	UPGMA
Lee and Goldsmith, 2013	Sets of characters	DL variant	greedy bottom-up
This work	Local patterns	DL	greedy bottom-up
This work	Global patterns	DL	greedy bottom-up

Features of our approach:

- ▶ Principled notion of Inflectional Realization.
- ▶ Using a measure that evaluates the quality of the system allows us to infer macroscopic generalisations.
- ▶ No parameters to adjust: **Occam's razor** is the only criterion.

TABLE OF CONTENTS

1. What form should an Inflection class (IC) system take?
2. What generalisations should we infer from the data?
3. How do we assess which lexemes inflect alike?
4. How do we find the best classes among all possible ones?
5. Results and discussion
6. Conclusion

- ▶ **Main properties:**
 - ▶ Based on information-theoretic measures.
 - ▶ Relies on automatically inferred generalisations.
 - ▶ Aims at cross-linguistic applications.
 - ▶ Formal definition of macroclasses and microclasses.
- ▶ An analysis into macroclasses can be empirically motivated.
- ▶ **Local segmentation** better captures the structure in inflection systems than global segmentation.
 - ▶ Supports the relevance of local patterns of alternation in abstractive approaches (Blevins, 2006).
 - ▶ Complementary to work on information-theoretic modelling of implicative structure (Ackerman, Blevins, and Malouf, 2009; Ackerman and Malouf, 2013; Bonami and Beniamine, 2015)
